

Our **comprehensive website analysis** connects technical evidence, visitor data, search findings, and server-level signals into a prioritized plan for improving your website.

\$445 - \$623 Typical Duration: 5 - 7 Hours

Investigate the Whole Website Before Deciding What to Fix

Individual dashboards show isolated symptoms. Liquid Purple's Client Command application brings the available evidence together so we can examine how the website, hosting environment, search visibility, content, traffic, and recurring errors affect one another.

With your authorization, we connect securely to the website and supporting data sources, collect current snapshots, normalize the results, and review the combined report. AI assists with comparing findings and identifying relationships across a large body of technical data; a human validates the conclusions, removes noise, and turns the useful findings into an actionable task list.

Evidence from Multiple Sources

Client Command consolidates the sources available and appropriate for the website being reviewed.

- **Logs and monitoring:** Review recurring application, HTTP, security, resource, availability, and service-check signals where access is available.
- **Analytics and search:** Examine supported traffic, behavior, acquisition, landing-page, search-visibility, and ranking data.
- **Crawls and page analysis:** Identify broken responses, metadata and heading gaps, content and linking problems, indexability concerns, and page-level SEO findings.
- **Server and application health:** Inspect relevant PHP, configuration, database, CMS, and technical-environment findings through authorized remote access.

Analysis That Leads to Action

The goal is not another stack of exports. It is a defensible sequence of work.

- **AI-assisted evaluation:** Use structured prompts and combined report data to compare sources, surface relationships, and draft explanations and priorities.
- **Human validation:** Review the evidence and AI-assisted findings, reject weak conclusions, account for business context, and confirm what is actionable.
- **Prioritized task list:** Organize confirmed work by urgency, impact, dependency, and practical sequence instead of treating every warning equally.
- **Implementation path:** Move approved tasks into Client Command work runs so fixes can be completed, documented, and checked against updated evidence.

From Investigation to Improvement

Collect & Correlate

Build a current, multi-source view of the website rather than relying on a single scan or score.

Evaluate & Prioritize

Combine AI assistance with expert review to distinguish meaningful problems from noise and order the work.

Implement & Verify

Authorize the resulting tasks for implementation, then use new evidence to confirm the changes and guide the next cycle.

Analysis Scope & Implementation

The displayed estimate covers the comprehensive analysis phase for one website: access setup, available data collection, Client Command report preparation, AI-assisted evaluation, human review, and a prioritized task list. Coverage depends on authorized access, configured tools, available historical data, site size, and source compatibility. The time required to implement findings cannot be known until the investigation is complete; fixes, content changes, redesign, custom development, paid third-party services, and ongoing monitoring are scheduled and billed separately after approval. Credentials are handled through protected Client Command connection records and used only for authorized collection and implementation work.
