

Proactive **hardening of a working site** to prevent future attacks before they happen.

\$200 - \$350 Duration: 2 - 4 Hours

Lock the Doors

Default CMS installations are easy targets for bots. We implement "Defense in Depth" strategies to make your site invisible to automated scanners and impenetrable to brute-force attacks.

We configure Web Application Firewalls (WAF), disable dangerous PHP functions, and hide your login pages from the public internet.

Security Layers

Admin Obfuscation

Moving your login page to a secret URL and adding 2FA (Two-Factor Authentication).

File Permissions

Locking down core folders so scripts cannot be executed in upload directories.

WAF Config

Setting up Cloudflare or local firewall rules to block known bad IPs and botnets.
