Category: Performance Engineering - Speed Is Non-Negotiable for Users

Updating **aging PHP applications** to modern standards (PHP 8.2+) to improve security and maintainability.

Starting at $1,500 Duration: Varied

Fix Technical Debt

Running on outdated PHP versions (5.6 or 7.x) is a security liability. **Legacy Code Refactoring** brings your mission-critical applications into the modern era without rewriting them from scratch.

We analyze your codebase, replace deprecated functions, normalize database queries, and harden security inputs so your application is compatible with modern, faster servers.

Refactoring Process

Modern Syntax

Updating code to efficient PHP 8+ standards, improving readability and execution speed.

Security Hardening

Patching SQL injection vulnerabilities and implementing modern input validation.

DB Normalization

Optimizing inefficient database structures that have grown messy over years of patching.
