

A comprehensive **speed optimization overhaul** designed to pass Google's Core Web Vitals assessment.

\$450 - \$900 Duration: 3 - 6 Hours

Speed = Revenue

Slow sites lose ranking and customers. Google's **Core Web Vitals** (LCP, CLS, INP) are now a direct ranking factor. If you are failing these metrics, you are invisible to a large portion of your audience.

We perform deep-level server and code optimizations usually reserved for enterprise applications, ensuring your site loads instantly and stays stable during layout shifts.

Technical Optimizations

Server Caching

Configuration of Redis, Varnish, or advanced Cloudflare/Sucuri caching rules to serve static content instantly.

Asset Compression

Next-gen image conversion (WebP/AVIF) and aggressive minification of CSS and JavaScript files.

Database Tuning

Cleaning overhead, optimizing tables, and indexing heavy queries to reduce Time To First Byte (TTFB).
